AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in this application:

Listing of Claims:

1. (Currently amended) A <u>processor-implemented</u> method of selectively sharing a plurality of distributed access-controlled documents, comprising:

a plurality of content providers cooperating to create a privacy-preserving index structure; ~~and~~

<u>grouping the content providers into a plurality of privacy groups;</u>

the privacy-preserving index structure mapping a plurality of keywords representing a content to be shared to the plurality of content providers<u>; and</u>

<u>returning a list of the content providers having a subset of the content to be shared of the access-controlled documents that comprise a set of the keywords that satisfy a query.</u>

2. (Currently amended) The method of claim 1, wherein the content providers comprise a provider specific search interface for receiving ~~a~~ <u>the</u> query and for authenticating a searcher.

3. (Currently amended) The method of claim 2, further comprising the searcher submitting the query containing ~~one or more~~ <u>at least one of the</u> keywords to a privacy-preserving index system.

4. (Canceled)

5. (Original) The method of claim 4, wherein the list of content providers comprises at least 50% false positive content providers.

6. (Original) The method of claim 4, further comprising the searcher submitting the query annotated with an identity for the searcher to a specified content provider on the list of content providers. (Original)

7. (Original) The method of claim 6, further comprising the specified content provider authenticating the identity of the searcher for allowing access to the content to be shared.

8. (Currently amended) The method of claim 7, further comprising the specified content provider returning to the searcher ~~at least~~ one ~~or~~ of a plurality of documents that match the one or more keywords.

9. (Canceled)

10. (Original) The method of claim 1, wherein the at least one privacy group comprises at least three contents.

11. (Original) The method of claim 1, wherein each of the content providers is grouped into one privacy group.

12. (Original) The method of claim 10, further comprising performing a randomized index construction algorithm to create the bit vectors for the content providers in the at least one privacy group.

3

13. (Original) The method of claim 12, further comprising arranging the content providers in the privacy group in a ring formation.

14. (Currently amended) The method of claim 13, further comprising creating bit vectors for the plurality of content providers for the at least one or more of the keywords representing a content to be shared.

15. (Original) The method of claim 14, further comprising combining the bit vectors into group vectors.

16. (Original) The method of claim 15, further comprising storing the group vectors in a privacy-preserving index.

17. (Original) The method of claim 13, wherein creating the bit vectors for the content providers comprises creating a randomized bit vector.

18. (Original) The method of claim 17, further comprising passing the randomized bit vector to a first provider in the ring formation in the privacy group.

19. (Original) The method of claim 12, wherein a content provider performs the randomized index construction algorithm to create a provider keyword bit vector.

20. (Original) The method of claim 18, further comprising the first provider passing the provider keyword bit vector to a next content provider in the ring formation in the privacy group.

21. (Original) The method of claim 19, wherein content providers in the ring formation sequentially perform the randomized index construction algorithm on the provider keyword bit vector.

22. (Original) The method of claim 21, further comprising the content providers in the ring formation passing provider keyword bit vectors and performing the randomized construction algorithm on the keyword bit vector until the provider keyword bit vector has completed r rounds around the ring formation.

23. (Original) The method of claim 22, further comprising ORing the provider keyword bit vectors into a group keyword bit vector.

24. (Original) The method of claim 23, wherein ORing the provider keyword bit vectors into the group keyword bit vector introduces false positives in a result returned in response to the query.

25. (Currently amended) A computer program product having a plurality of executable instruction codes stored on a computer readable medium, for selectively sharing a plurality of distributed access-controlled documents, comprising:

a plurality of content providers comprising a first set of instruction codes for cooperating to create a privacy-preserving index structure; and

a set of instruction codes for grouping the content providers into a plurality of privacy groups;

the privacy-preserving index structure comprising a ~~second~~ set of instruction codes for mapping a plurality of keywords representing a content to be shared to the plurality of content providers; and

<u>a set of instruction codes for returning a list of the content providers having a subset of the content to be shared of the access-controlled documents that comprise a set of the keywords that satisfy a query</u>.

26. (Currently amended) The computer program product of claim 25, wherein the content providers comprise a ~~third~~ set of instruction codes for receiving ~~a~~ <u>the</u> query and for authenticating a searcher.

27. (Currently amended) The computer program product of claim 26, further comprising the searcher submitting the query containing ~~one or more~~ <u>at least one of the</u> keywords to a privacy-preserving index system.

28 - 29. (Canceled)

30. (Currently amended) The computer program product of claim 29, further comprising a ~~fifth~~ set of instruction codes for performing a randomized index construction algorithm to create the bit vectors for the content providers in the plurality of privacy groups.

31. (Currently amended) A processor-implemented system for selectively sharing a plurality of distributed access-controlled documents, comprising:

a plurality of content providers that cooperate to create a privacy-preserving index structure; ~~and~~

means for grouping the content providers into a plurality of privacy groups;

means for the privacy-preserving index structure ~~map~~ mapping a plurality of keywords representing a content to be shared to the plurality of content providers; and

means for returning a list of the content providers having a subset of the content to be shared of the access-controlled documents that comprise a set of the keywords that satisfy a query.

32. (Currently amended) The system of claim 31, wherein the content providers comprise a provider specific search interface for receiving ~~a~~ the query and for authenticating a searcher.

33. (Currently amended) The system of claim 32, wherein the searcher submits the query containing ~~one or more~~ at least one of the keywords to a privacy-preserving index system.

34. (Original) The system of claim 33, wherein on receiving the query, at least some of the content providers return a list of filtered documents.

35. (Canceled)

7
